

Zinc Aluminium flake coating

Zinc Aluminium flake coating is a thermosetting containing Zinc and Aluminum as a corrosion inhibiting pigment offers excellent corrosion resistance with good reflectivity and heat resistance. It is aesthetically silvery in color. The heat cured resin has excellent corrosion resistance with good adhesion to the substrate.

Applications

-] To replace pollute chrome, nickel and various plating
-] Areas operating in high corrosive environment
-] It can withstand temperature up to 275°C
-] Replaces powder coating
-] Thickness can be given as low of 10 microns with good corrosion resistance
-] Good adhesion and abrasion resistance compared to painting and powder coating
